

Product Requirements Document: Daily Routine Guide App

Working title: DayGuide (placeholder, rename freely) **Platforms:** Android only (personal use, installed directly on the owner's phone) **Version:** 1.0 (MVP) **Status:** Draft

1. Overview

DayGuide is a calendar and timetable app that learns about a person (their schedule, goals, habits, and constraints) and then actively guides them through each day. Instead of a passive calendar the user must check, the app keeps bringing the day to the user: what to do now, what is next, what was missed, and how to adjust.

The app is built for one person, the owner, on an Android phone. It is installed directly on that phone (no Play Store release, no iOS version) and works fully offline.

2. Problem Statement

Most calendar and to-do apps store information but do not guide behaviour. People plan their day, then lose track, get distracted, or forget their own routine. They need something that:

- Knows how they want their day to go
- Reminds them at the right moments
- Helps them recover when the day goes off plan

3. Vision and Goals

Vision: A personal day coach that turns a routine into daily action.

Goals

1. Let a user describe themselves and their ideal day once, then generate a usable daily timetable.
2. Keep the user on track with timely, non-annoying prompts throughout the day.
3. Run reliably on the owner's Android phone, including offline and after a restart.
4. Help users build consistency over time through tracking and review.

Non-goals (MVP)

- iOS version, Play Store release, accounts, and multi-user or shared calendars
- Payments or marketplace features
- Deep third-party integrations beyond calendar import

4. Target Users

The only user is the owner, using an Android phone. The app is tuned to one person's schedule, habits, goals, and energy patterns: structure for work and projects, study, rest, meals, and personal routines such as devotion, exercise, reading, and learning.

5. Core Concept: How the App Works

1. **Onboarding:** The user gives information about themselves (wake and sleep times, work or school hours, commitments, habits, goals, energy patterns).
2. **Routine building:** The app turns that into a daily timetable made of time blocks and recurring routines.
3. **Daily guidance:** Each day, the app presents the plan, prompts the user at each transition, and tracks completion.
4. **Adaptation:** When tasks are missed or the day changes, the app helps re-plan the rest of the day.
5. **Review:** End-of-day and weekly summaries show progress and suggest improvements.

6. Key Features

6.1 Profile and Onboarding (P0)

- Short guided questionnaire: wake/sleep time, work/school schedule, meals, fixed commitments, goals, habits to build, preferred focus times.
- Editable at any time from a Profile screen.
- Option to skip detail and start with a template (e.g. Student, Freelancer, General).

6.2 Timetable and Calendar (P0)

- Day, week, and month views.
- Time blocks with title, start/end, category, notes, colour, and priority.

- Recurring routines (daily, weekdays, custom days).
- Drag to move or resize blocks (touch).
- Conflict detection when blocks overlap.

6.3 Daily Guide / "Today" Screen (P0)

The home screen of the app.

- **Now:** the current block, with a timer and a Done / Skip / Snooze action.
- **Next:** what is coming up and when.
- **Remaining:** the rest of the day at a glance.
- Progress ring showing percentage of the day completed.
- Morning briefing summary and evening wrap-up.

6.4 Smart Reminders and Notifications (P0)

- Local scheduled notifications on Android (no server needed).
- Configurable lead time (e.g. 10 minutes before a block).
- Quiet hours and Do Not Disturb respected.
- Actionable notifications (mark done, snooze, reschedule) without opening the app.

6.5 Task and Habit Tracking (P1)

- Simple task list that can be dragged into the timetable.
- Habit streaks (e.g. daily reading, exercise, devotion).
- Completion history per block, task, and habit.

6.6 Adaptive Re-planning (P1)

- If the user falls behind, the app suggests a revised plan for the remainder of the day.
- One-tap "Reschedule missed items" to the next free slots.
- Learns typical durations (e.g. a task estimated at 30 minutes that usually takes 50).

6.7 AI Planning Assistant (P1)

- Natural-language input: "Plan my day around a 2pm client call and gym."
- Generates or adjusts the timetable and explains the changes.
- Suggests better time allocation based on goals and energy patterns.

- User must always confirm before changes are applied.

6.8 Insights and Reviews (P2)

- Daily summary: completed vs planned.
- Weekly report: time per category, streaks, best and worst days.
- Gentle suggestions to improve the routine.

6.9 Storage, Backup, and Import/Export (P0 / P2)

- All data stored locally on the phone; no account or login. (P0)
- Works fully offline. (P0)
- Manual backup and restore to a file the owner can keep in cloud storage. (P1)
- Import from Google Calendar. (P2)
- Export to calendar file (.ics). (P2)

6.10 Settings and Personalisation (P1)

- Light and dark theme.
- Notification preferences, week start day, time format, time zone.
- Language (English first).

7. User Stories

- As a new user, I want to answer a few questions about my life so the app can build my day for me.
- As a user, I want to open the app and immediately see what I should be doing right now.
- As a user, I want a reminder before each activity so I do not forget my routine.
- As a user, I want to mark tasks done or skipped quickly so tracking does not feel like work.
- As a user, when my day goes wrong, I want the app to re-arrange what is left so I can still finish what matters.
- As a user, I want to see my progress over the week so I stay motivated.
- As a user, I want my timetable and reminders to work on my Android phone even with no internet.

8. Key User Flows

First-time flow: Install the app on the phone → Onboarding questions → Review generated timetable → Adjust → Enable notifications → Land on Today screen.

Daily flow: Morning briefing notification → Open Today screen → Work through blocks (Done / Skip / Snooze) → Receive reminders → Evening wrap-up → Plan tomorrow.

Off-plan flow: Missed block detected → Prompt "Reschedule?" → App proposes new slots → User confirms.

9. Screens (MVP)

1. Welcome
2. Optional app lock (PIN or fingerprint)
3. Onboarding questionnaire
4. Today (home)
5. Calendar (day / week / month)
6. Add / Edit block
7. Tasks and Habits
8. AI Assistant chat
9. Insights
10. Profile and Settings

10. Functional Requirements

ID	Requirement	Priority
FR-1	Data is stored on the phone; no account needed	P0
FR-2	Users complete onboarding and receive a generated timetable	P0
FR-3	Users can create, edit, delete, and recur time blocks	P0
FR-4	Today screen shows Now, Next, and Remaining blocks	P0

ID	Requirement	Priority
FR-5	Users receive reminders before blocks begin	P0
FR-6	Users can mark blocks done, skipped, or snoozed	P0
FR-7	Backup and restore to a file	P0
FR-8	Missed blocks can be rescheduled in one tap	P1
FR-9	Tasks and habits with streaks	P1
FR-10	AI assistant proposes timetable changes for user approval	P1
FR-11	Full offline use on Android	P1
FR-12	Daily and weekly insights	P2
FR-13	Google Calendar import and .ics export	P2

11. Non-Functional Requirements

- **Performance:** Today screen loads in under 2 seconds on the owner's phone.
- **Reliability:** Reminders fire accurately, including when the app is closed, after a phone restart, and across time-zone changes.
- **Privacy:** All data stays on the phone unless the owner exports it.
- **Accessibility:** Readable font sizes and sufficient contrast.
- **Compatibility:** The owner's Android version (confirm the version and phone model before building).
- **Maintainability:** Simple enough for one person to update and rebuild.

12. Suggested Technical Approach

These are recommendations, adjust to the tool you build with.

- **Client:** A native Android app, or one cross-platform framework (e.g. Flutter or React Native) built for Android only.
- **Storage:** Local database on the phone (e.g. SQLite), no backend required.
- **Notifications:** Local scheduled alarms and notifications, with exact-alarm and battery-optimisation permissions handled, and reminders rescheduled after a phone restart.

- **AI layer (optional, Phase 2):** An LLM API for planning suggestions, with the schedule sent as structured data and replies returned as structured JSON. Needs internet and a protected API key.
- **Data model (core entities):** Profile, Routine, TimeBlock, Task, Habit, Completion, Notification setting.

13. Success Metrics

- Percentage of planned blocks completed per day
- Days per week the owner opens the Today screen
- Reminder action rate (done / snooze / reschedule)
- Habit streak length
- Whether the owner is still using the app after 30 days

14. Release Plan

Phase	Scope
MVP (Phase 1)	Onboarding, timetable and calendar, Today screen, local reminders, mark done/skip/snooze, offline storage
Phase 2	Tasks and habits, adaptive re-planning, AI assistant, backup and restore
Phase 3	Insights and reports, Google Calendar import, export
Later	Home-screen widget, voice input

15. Installation (Personal Use)

- Installed directly on the owner's Android phone as an APK; no Play Store listing, privacy policy, or store review needed
- Phone set to allow installs from the chosen source
- Battery optimisation turned off for the app so reminders always fire
- Backup file kept outside the phone in case it is lost or reset

16. Risks and Mitigations

Risk	Mitigation
Notifications become annoying and get ignored	Quiet hours, adjustable frequency, smart batching
Onboarding feels long	Short questionnaire plus templates; fill details later
Reminders unreliable because of Android battery optimisation	Exempt the app from battery optimisation; use exact alarms; reschedule after restart
AI suggestions are wrong or unwanted	Always require confirmation; easy undo
Data lost if the phone is lost or reset	Regular backup file kept outside the phone
Scope creep	Hold to the MVP list until Phase 1 works

17. Open Questions

1. Final app name?
2. Should the AI assistant be in the MVP or Phase 2?
3. Which tool or stack will be used to build it, so the technical section can be tailored?
4. Which Android version and phone model will it run on?
5. Should a web version be added later, or is Android enough?

This PRD is based on the initial product description and contains reasonable assumptions to fill gaps. Review the priorities and open questions, then adapt them to your build tool.
